Manish Sahu

Software Engineer | Java | Spring Boot | Distributed Systems | Kafka | AWS
+91-8480253611 | official.sahu.manish@gmail.com | LinkedIn | Portfolio

SUMMARY

Software Engineer with **5 years of experience** building production systems with Java, Spring Boot, Kafka, Redis, SQL, React, and AWS. Experienced in backend architecture, distributed systems, reliability, performance optimization, cloud migrations, and end-to-end feature ownership.

TECHNICAL SKILLS

Languages: Java 8/17, JavaScript, TypeScript, SQL **Backend:** Spring Boot, Spring Cloud, Hibernate/JPA, REST APIs, Microservices, Node.js, Express
Data / Messaging: Apache Kafka, Redis, PostgreSQL, MySQL, DynamoDB, MongoDB **Cloud:** AWS (S3, ECS, Lambda), Docker, GitHub Actions
Frontend: React.js **Testing:** JUnit, Mockito, Jest, Selenium, TestNG, SonarQube **Engineering:** Idempotency, Retry / Circuit Breaker, Optimistic Locking, Caching
AI-Assisted Development: Spring AI, GitHub Copilot Agent

EXPERIENCE

CrimsonLogic (via Innova Solutions) — Bengaluru, India Nov 2025 – Present
Software Engineer (Contract)

- Designed and executed an application-wide migration of **80K production and 10K UAT documents to Amazon S3**, introducing dual-storage reads before migration to keep the application operational throughout the transition and avoid a disruptive cutover.
- Built a resumable migration workflow that processes documents by creation-date windows and persists progress in database configuration; made processing **idempotent and retry-safe** with up to 3 retries and failure auditing for persistent errors.
- Eliminated cache-stampede issues on warehouse and payment endpoints by building runtime per-key miss-ratio monitoring and switching hot keys from cache-aside to write-through, removing recurring timeout complaints from affected flows.
- Hardened Kafka consumer processing against duplicate and failed delivery using stable message keys, transactional database deduplication, exponential-backoff retries, and failure audit logging.
- Hardened customs integrations against external API failures by migrating to updated government APIs and adding Resilience4j circuit-breaker and retry handling to prevent cascading failures.

Infosys — Bengaluru, India May 2023 – Nov 2025
Software Engineer

- Built a Kafka-based approval workflow that consolidated events from multiple services into a user/role data model and maintained dashboard state in Redis, **reducing 1,000-record dashboard load time from 1 minute to 4 seconds**.
- Designed a schema-driven form platform using Spring Boot BFF and React, replacing static form implementations with backend-driven validation schemas; migrated **45+ forms and reduced new-form setup from roughly 3 days to minutes**.
- Integrated **natural-language search** into a banking backend search system using Spring AI, connecting a lightweight LLM developed by the data team to translate complex user requests into structured filters and applying those filters to database queries.
- Resolved a production N+1 query bottleneck with join-based data access; tuned HikariCP and added API pagination to reduce database round-trips, connection queuing, and oversized responses.
- Prevented concurrent approval updates from silently overwriting each other by introducing optimistic locking with a SQL version column and returning explicit conflict errors on stale writes.
- Defined REST contracts, enforced method-level authorization with Spring Security, participated in design reviews, and maintained **85%+ SonarQube coverage gates**.

Mindfire Solutions — Bhubaneswar, India Oct 2021 – Apr 2023
Software Test Engineer

- Automated regression workflows using Java, Selenium, TestNG, and Maven, reducing regression execution time by **20%**.
- Increased test coverage by **30%** across critical workflows and stabilized flaky automation to improve release reliability.

EDUCATION

Sambalpur University Institute of Information Technology — Burla, Odisha Aug 2017 – May 2021
Bachelor's in Computer Science Engineering
